

```
pki@pki:~$ #create a pki folder
pki@pki:~$ mkdir pki
pki@pki:~$ cd pki/
pki@pki:~/pki$ mkdir rootca subca web
pki@pki:~/pki$ cd rootca/
pki@pki:~/pki/rootca$ mkdir certs csr private
pki@pki:~/pki/rootca$ #certs --> certificates, csr --> certificate signing request, private --> private key
pki@pki:~/pki/rootca$ cd ../subca/
pki@pki:~/pki/subca$ mkdir certs csr private
pki@pki:~/pki/subca$ cd ../web/
pki@pki:~/pki/web$ mkdir certs csr private
pki@pki:~/pki/web$ # create for all three folders
pki@pki:~/pki/web$ ls
certs  csr  private
pki@pki:~/pki/web$ ls ../subca/
certs  csr  private
pki@pki:~/pki/web$ ls ../rootca/
certs  csr  private
pki@pki:~/pki/web$ cd ../rootca/
pki@pki:~/pki/rootca$ # create a key for rootca
pki@pki:~/pki/rootca$ openssl genrsa -out private/rootCA11.key 2048
pki@pki:~/pki/rootca$ ls private/
rootCA11.key
pki@pki:~/pki/rootca$ # Create self signed rootca certificate
pki@pki:~/pki/rootca$ openssl req -x509 -new -nodes -key private/rootCA11.key -sha256 -days 3650 -out certs/rootCA1.crt
```

Replace key name as rootCA11.key and certificate name as rootCA11.crt

```
pki@pki:~/pki/rootca$ openssl req -x509 -new -nodes -key private/rootCA11.key -sha256 -days 3650 -out certs/rootCA11.crt
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
-----
Country Name (2 letter code) [AU]:IN
State or Province Name (full name) [Some-State]:MH
Locality Name (eg, city) []:Pune
Organization Name (eg, company) [Internet Widgits Pty Ltd]:CDAC
Organizational Unit Name (eg, section) []:ACTS
Common Name (e.g. server FQDN or YOUR name) []:rootCA11
Email Address []:shrutib@gmail.com
pki@pki:~/pki/rootca$
```

Enter all this information your CA certificate is ready and it's a self-signed certificate

```
pki@pki: ~  
pki@pki:~/pKI/rootca$ # Now subCA key and Certificate  
pki@pki:~/pKI/rootca$ cd ../subca/  
pki@pki:~/pKI/subca$ openssl genrsa -out private/subCA11.key 2048  
pki@pki:~/pKI/subca$ ls private/  
subCA11.key  
pki@pki:~/pKI/subca$ # Create CSR for SubCA  
pki@pki:~/pKI/subca$ openssl req -new -key private/subCA11.key -out csr/subCA11.csr

pki@pki:~/pKI/web$
```

Create SSL Extension File

Create:

nano server_ext.cnf

.

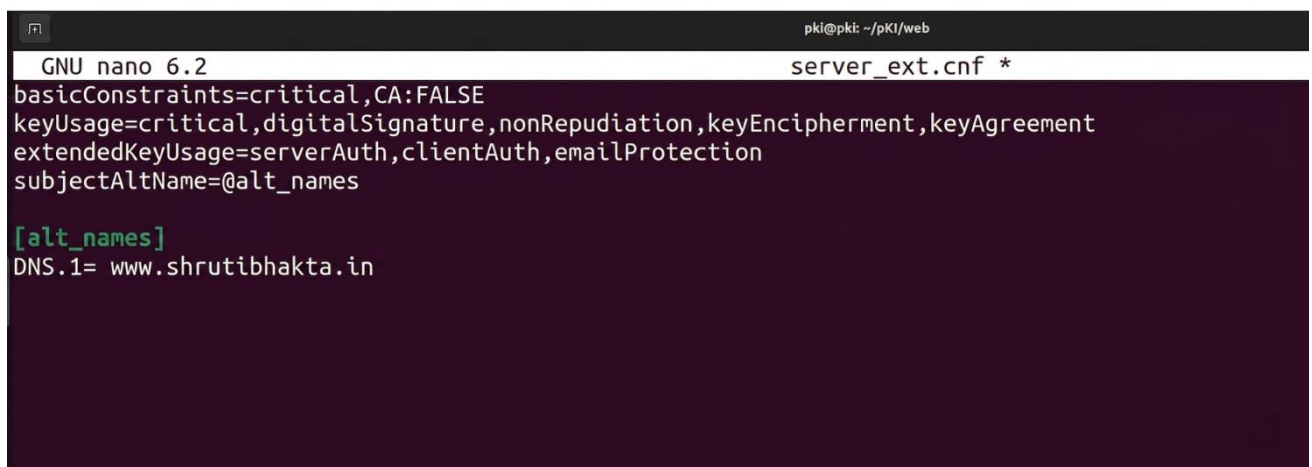

A terminal window with a dark purple background. The prompt is 'pki@pki: ~/pKI/web\$'. The command 'nano server_ext.cnf' has been entered and is highlighted in green.

Paste:

```
basicConstraints=critical,CA:FALSE
keyUsage=critical,digitalSignature,nonRepudiation,keyEncipherment,keyAgreement
extendedKeyUsage=serverAuth,clientAuth,emailProtection
subjectAltName=@alt_names
```

[alt_names]

DNS.1= www.shrutibhakta.in

A terminal window showing the contents of the 'server_ext.cnf' file. The header shows 'GNU nano 6.2' and 'server_ext.cnf *'. The file content is: 'basicConstraints=critical,CA:FALSE', 'keyUsage=critical,digitalSignature,nonRepudiation,keyEncipherment,keyAgreement', 'extendedKeyUsage=serverAuth,clientAuth,emailProtection', 'subjectAltName=@alt_names', '[alt_names]', and 'DNS.1= www.shrutibhakta.in'. The prompt is 'pki@pki: ~/pKI/web'.

Save and exit

Sign Website Certificate Using SubCA

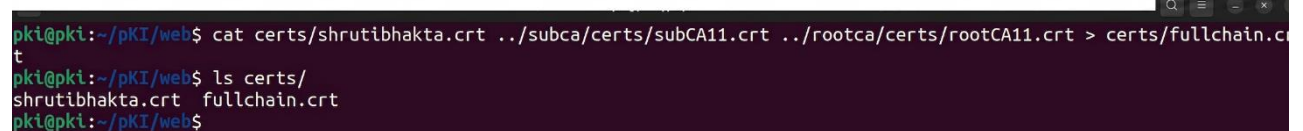

```
openssl x509 -req -in csr/shrutibhakta.csr -CA ../subca/certs/subCA11.crt -CAkey  
../subca/private/subCA11.key -CAcreateserial -out certs/shrutibhakta.crt -days 365 -sha256 -extfile  
server_ext.cnf
```

Create Full Chain File for Apache/Nginx

A terminal window with a dark background and green text. The prompt is 'pki@pki:~/pKI/web\$'. The command entered is 'openssl x509 -req -in csr/shrutibhakta.csr -CA ../subca/certs/subCA11.crt -CAkey ../subca/private/subCA11.key -CAcreateserial -out certs/shrutibhakta.crt -days 365 -sha256 -extfile server_ext.cnf'. The output shows 'Certificate request self-signature ok', 'CERTIFICATE REQUEST SERIAL -oN.03 -sha256 - SLLTIBHAKTA -AC0', and 'subject=C = IN, ST = MH, L = Pune, O = CDAC, OU = ACTS, CN = www.shrutibhakta.in, emailAddress = shrutib@gmail.com'. The prompt returns to 'pki@pki:~/pKI/web\$'.

```
pki@pki:~/pKI/web$ openssl x509 -req -in csr/shrutibhakta.csr -CA ../subca/certs/subCA11.crt -CAkey ../subca/private/subC  
A11.key -CAcreateserial -out certs/shrutibhakta.crt -days 365 -sha256 -extfile server_ext.cnf  
A11.11.key -xa256 -extfile server_ext.cnf  
Certificate request self-signature ok  
CERTIFICATE REQUEST SERIAL -oN.03 -sha256 - SLLTIBHAKTA -AC0  
subject=C = IN, ST = MH, L = Pune, O = CDAC, OU = ACTS, CN = www.shrutibhakta.in, emailAddress = shrutib@gmail.com  
pki@pki:~/pKI/web$
```

```
cat certs/shrutibhakta.crt ../subca/certs/subCA11.crt ../rootca/certs/rootCA11.crt >  
certs/fullchain.crt
```

A terminal window with a dark background and green text. The prompt is 'pki@pki:~/pKI/web\$'. The command entered is 'cat certs/shrutibhakta.crt ../subca/certs/subCA11.crt ../rootca/certs/rootCA11.crt > certs/fullchain.crt'. The output shows the file being created. The prompt returns to 'pki@pki:~/pKI/web\$'.

```
pki@pki:~/pKI/web$ cat certs/shrutibhakta.crt ../subca/certs/subCA11.crt ../rootca/certs/rootCA11.crt > certs/fullchain.c  
t  
pki@pki:~/pKI/web$ ls certs/  
shrutibhakta.crt  fullchain.crt  
pki@pki:~/pKI/web$
```

Create a forward zone for DNS

If someone don't have dns configured then first they need to configure it

- 1) sudo apt-get update -y; sudo apt-get upgrade -y
- 2) sudo apt install bind9 (use sudo only if not logged in through user)
- 3) sudo apt install dnsutils

copy db.local to your db.shrutibhakta.local

4) sudo su

5) cd /etc/bind/

6) cp db.local db.shrutibhakta.local

A terminal window with a dark purple background. The title bar shows a window icon and the text 'root@pki: /etc/bind'. The terminal content shows a user 'pki' at a machine 'pki' in the directory '~/pKI/web' running 'sudo su'. After a password prompt, the user becomes 'root' at 'pki' in the directory '/home/pki/pKI/web'. The user then runs 'cd /etc/bind/' and '# open named.conf.local file', followed by 'nano named.conf.local'. The prompt returns to 'root@pki:/etc/bind#' with a cursor.

```
pki@pki:~/pKI/web$ sudo su
[sudo] password for pki:
root@pki:/home/pki/pKI/web# cd /etc/bind/
root@pki:/etc/bind# # open named.conf.local file
root@pki:/etc/bind# nano named.conf.local
root@pki:/etc/bind#
```

```
root@pki: /etc/bind
GNU nano 6.2 named.conf.local *
//
// Do any local configuration here
//
// Consider adding the 1918 zones here, if they are not used in your
// organization
//include "/etc/bind/zones.rfc1918"

zone "shrutibhakta.in" {
    type master;
    file "/etc/bind/db.shrutibhakta.local";
};
```

I have already bind9 installed so I will change the name of db.local file and edit

```
root@pki: /etc/bind
pki@pki:~/pki/web$ sudo su
[sudo] password for pki:
root@pki:/home/pki/pki/web# cd /etc/bind/
root@pki:/etc/bind# # open named.conf.local file
root@pki:/etc/bind# nano named.conf.local
root@pki:/etc/bind# nano named.conf.local
root@pki:/etc/bind# ls
bind.keys  db.127  db.ccee.com.local  db.local  named.conf.default-zones  named.conf.options  zones.rfc1918
db.0       db.255  db.empty           named.conf  named.conf.local         ndc.key
root@pki:/etc/bind# mv db.ccee.com.local db.shrutibhakta.local
root@pki:/etc/bind# ls
bind.keys  db.127  db.shrutibhakta.local  db.local  named.conf.default-zones  named.conf.options  zones.rfc1918
db.0       db.255  db.empty              named.conf  named.conf.local         ndc.key
root@pki:/etc/bind#
```

Now edit db.shrutibhakta.local file to create forward zone

```
root@pki: /etc/bind
root@pki:/etc/bind# nano db.shrutibhakta.local
```

```
Activities Terminal Jun 11 20:34 root@pki: /etc/bind
GNU nano 6.2 db.shrutibhakta.local *
;
; BIND data file for local loopback interface
;
$TTL 604800
@ IN SOA shrutibhakta.in. root.shrutibhakta.in. (
; Serial
604800 ; Refresh
86400 ; Retry
2419200 ; Expire
604800 ) ; Negative Cache TTL
;
@ IN NS ns.shrutibhakta.in.
@ IN A 192.168.142.142
@ IN AAAA ::1
ns IN A 192.168.142.142
```

Save and exit

Now edit file named.conf.options

```
root@pki: /etc/bind
root@pki:/etc/bind# nano named.conf.options
```

```
GNU nano 6.2                                root@pki: /etc/bind
named.conf.options
options {
    directory "/var/cache/bind";

    // If there is a firewall between you and nameservers you want
    // to talk to, you may need to fix the firewall to allow multiple
    // ports to talk.  See http://www.kb.cert.org/vuls/id/800113

    // If your ISP provided one or more IP addresses for stable
    // nameservers, you probably want to use them as forwarders.
    // Uncomment the following block, and insert the addresses replacing
    // the all-0's placeholder.

    forwarders {
        192.168.142.142;
    };

    //=====
    // If BIND logs error messages about the root key being expired,
    // you will need to update your keys.  See https://www.isc.org/bind-keys
    //=====
    dnssec-validation auto;

    listen-on-v6 { any; };
}
```

Save and exit

Now restart bind 9 service

systemctl restart bind9.service

```
root@pki: /etc/bind
root@pki:/etc/bind# nano named.conf.options
root@pki:/etc/bind# systemctl restart bind9.service
root@pki:/etc/bind#
```

Now create a virtual host file but first copy website key, chain certificate and rootCA certificate in ~/certs folder

```
pki@pki: ~  
pki@pki:~$ ls certs/  
ccee.com.pem  ccee_key.pem  root_ca.crt  
pki@pki:~$ #first remove all these data  
pki@pki:~$ cd certs/  
pki@pki:~/certs$ rm -rf *  
pki@pki:~/certs$ ls  
pki@pki:~/certs$ cd -  
/home/pki  
pki@pki:~$
```

```
pki@pki: ~  
pki@pki:~$ ls certs/  
shrutibhakta.key  fullchain.crt  rootCA11.crt  
pki@pki:~$
```

Virtual host file

Go to sites-available folder

```
root@pki: /etc/apache2/sites-available
root@pki:/etc/bind# cd /etc/apache2/sites-available/
root@pki:/etc/apache2/sites-available#
```

```
root@pki:/etc/apache2/sites-available# ls
000-default.conf ccee.com.conf default-ssl.conf
root@pki:/etc/apache2/sites-available# # Now I need to rename file ccee.com.conf to
`shrutibhakta-ssl.conf
root@pki:/etc/apache2/sites-available# mv ccee.com.conf shrutibhakta-ssl.conf
```

Now open shrutibhakta-ssl.conf file

```
GNU nano 6.2 shrutibhakta-ssl.conf *
<VirtualHost *:443>
    ServerName shrutibhakta.in
    DocumentRoot /var/www/html

    SSLEngine on
    SSLCertificateFile /home/pki/certs/fullchain.crt
    SSLCertificateKeyFile /home/pki/certs/shrutibhakta.key
    SSLCACertificateFile /home/pki/certs/rootCA11.crt
</VirtualHost>
```

Save and exit

Now enable the ssl module and enable the site

```
# a2enmod ssl
```

```
# a2ensite shrutibhakta-ssl
```

```
root@pki: /etc/apache2/sites-available
root@pki:/etc/apache2/sites-available# a2enmod ssl
Considering dependency setenvif for ssl:
Module setenvif already enabled
Considering dependency mime for ssl:
Module mime already enabled
Considering dependency socache_shmcb for ssl:
Module socache_shmcb already enabled
Module ssl already enabled
root@pki:/etc/apache2/sites-available#
```

```
root@pki: /etc/apache2/sites-available
root@pki:/etc/apache2/sites-available# a2ensite shrutibhakta-ssl
Enabling site shrutibhakta-ssl.
To activate the new configuration, you need to run:
    systemctl reload apache2
root@pki:/etc/apache2/sites-available#
```

Now reload apache2 and restart

```
root@pki: /etc/apache2/sites-available
root@pki:/etc/apache2/sites-available# a2ensite shrutibhakta-ssl
Enabling site shrutibhakta-ssl.
Enabling site shrutibhakta-ssl.
To activate the new configuration, you need to run:
    systemctl reload apache2
root@pki:/etc/apache2/sites-available# systemctl reload apache2
root@pki:/etc/apache2/sites-available# systemctl restart apache2
root@pki:/etc/apache2/sites-available#
```

Now use winscp:

Copy all data of certs folder from ubuntu to base machine (windows 11)

Import all certificates in cert manager

Import CA certificate

Import personal certificate

Edit your base machine host file

Right click on notepad and open as administrator

Now save the below file

```
*hosts - Notepad
File Edit Format View Help
# Copyright (c) 1993-2009 Microsoft Corp.
#
# This is a sample HOSTS file used by Microsoft TCP/IP for Windows.
#
# This file contains the mappings of IP addresses to host names. Each
# entry should be kept on an individual line. The IP address should
# be placed in the first column followed by the corresponding host name.
# The IP address and the host name should be separated by at least one
# space.
#
# Additionally, comments (such as these) may be inserted on individual
# lines or following the machine name denoted by a '#' symbol.
#
# For example:
#
#       102.54.94.97      rhino.acme.com          # source server
#       38.25.63.10      x.acme.com              # x client host

# localhost name resolution is handled within DNS itself.
#       127.0.0.1        localhost
#       ::1              localhost

192.168.142.142          www.shrutibhakta.in|
```

Save and exit then check into browser in private mode or normal mode
